

**Claim Amendments**

1-20. (canceled)

21. (new) An apparatus for determining vision defects and for collecting data for correcting vision defects of the eye of a patient by interaction with the patient, said apparatus comprising:

an adaptive optical system being configured to form an image to be perceived by the patient;

an electronic control system being operatively connected to said adaptive optical system;

said electronic control system comprising an arrangement configured to modify, at least once, the optical characteristics of said adaptive optical system in an attempt to minimize the distortions of the image as perceived by the patient through interaction with the patient;

an arrangement being configured to determine the modified optical characteristics of said adaptive optical system upon the patient perceiving minimized distortions of the image; and

apparatus being configured to determine vision correcting data from at least one signal indicating said modified optical characteristics

of said adaptive optical system.

22. (new) The apparatus according to Claim 21, wherein:  
said adaptive optical system comprises a micromirror device  
operatively connected to said electronic control system.

23. (new) The apparatus according to Claim 22, wherein:  
said micromirror device comprising a plurality of micromirrors.

24. (new) The apparatus according to Claim 23, wherein:  
said micromirrors are configured to individually change optical  
characteristics in response to output signals from said electronic  
control system independently of an adjacent micromirror.

25. (new) The apparatus according to Claim 24, wherein:  
said micromirrors are configured to generate signals indicative of  
the modified optical characteristics of said micromirrors resulting from  
said modified image having minimized distortions as perceived by the  
patient.

26. (new) The apparatus according to Claim 25, wherein:  
said micromirrors are configured to be moveable to and  
stoppable in a plurality of positions between a first extreme position  
and a second extreme position opposite from said first extreme

position.

27. (new) The apparatus according to Claim 26, wherein:  
said adaptive optical system is configured substantially as a  
segment of a sphere.

28. (new) The apparatus according to Claim 27, further  
comprising one of:

an aberrometer device configured to measure aberrations of the  
eye of the patient; and

an aberrometer device comprising a Shack-Hartmann sensor.

29. (new) The apparatus according to Claim 28, wherein:  
each micromirror is configured to be moved by a membrane; said  
membrane being configured to be actuated by a force of one of: an  
electrostatic arrangement, a piezo-electric arrangement, and a bimorph  
membrane arrangement; and

said electronic control system comprises a computer configured  
to compute vision correcting data using a Taylor polynomial and/or a  
Zernike polynomial on the basis of data from said aberrometer  
indicative of the aberrations of the eye of the patient, and vision  
correcting data computed from said adaptive optical system, as

modified.

30. (new) The apparatus according to Claim 27, wherein one of:

(a.) each micromirror is configured to be moved by a membrane; said membrane being configured to be actuated by a force of one of: an electrostatic arrangement, a piezo-electric arrangement, and a bimorph membrane arrangement;

(b.) said apparatus comprises an aberrometer device configured to measure aberrations of the eye of the patient;

(c.) said apparatus comprises an aberrometer device comprising a Shack-Hartmann sensor; and

(d.) said electronic control system comprises a computer configured to compute vision correcting data using a Taylor polynomial and/or a Zernike polynomial on the basis of data from said aberrometer indicative of the aberrations of the eye of the patient, and vision correcting data computed from said adaptive optical system, as modified.

31. (new) A method for determining vision defects and for collecting data for correcting vision defects of at least one eye of a patient by interaction with the patient using an optical system being

Docket No.: NHL-ASC-01-C2  
Serial No.: 10/827,463  
Customer No.: 00432

configured to have its optical characteristics changed by at least one signal from an electronic control system, said method comprising the steps of:

forming an image to be perceived by the patient with said optical system;

determining the presence of distortions of the image as perceived by the patient by interaction with the patient;

modifying, at least once, the optical characteristics of said optical system through outputting of at least one signal of said electronic control system in an attempt to minimize the distortions of the image as perceived by the patient by interaction with the patient;

determining the modified optical characteristics of said optical system upon the patient perceiving minimized distortions of the image; and

determining vision correcting data from at least one signal indicating said modified optical characteristics of said optical system.

32. (new) The method according to Claim 31, wherein:

said optical system comprises a micromirror device operatively connected to said electronic control system.

said micromirror device comprises a plurality of micromirrors;  
said micromirrors comprise arrangements configured to respond to output signals from said electronic control system; and  
said micromirrors are configured to change the optical characteristics in response to output signals from said electronic control system;  
said method comprising:  
providing at least one electrical signal from said electronic control system to said micromirrors to change the optical characteristics of said micromirror device.

33. (new) The method according to Claim 32, wherein:

said micromirrors are configured to generate signals indicative of the modified optical characteristics of said micromirrors resulting from said modified image upon the patient perceiving minimized distortions of the image;

said method comprising:  
providing at least one signal from said micromirrors indicative of the modified optical characteristics of said micromirrors to an arrangement for computing vision correcting data for the eye being

examined.

34. (new) The method according to Claim 33, wherein;  
said micromirrors are configured to be moveable to and  
stoppable in a plurality of positions between a first extreme position  
and a second extreme position opposite from said first extreme  
position;

said method comprising:

moving said micromirrors from a first position corresponding to  
an image as perceived by the patient to a second position  
corresponding to a modified image having minimized distortions as  
perceived by the patient.

35. (new) The method according to Claim 34, wherein:

said optical system is configured substantially as a segment of a  
sphere;

said method comprising:

projecting an image onto said optical system configured  
substantially as a segment of a sphere; and

reflecting an image to be perceived by the patient from said  
optical system configured substantially as a segment of a sphere.

36. (new) The method according to Claim 35, wherein:

each micromirror is configured to be moved by a membrane; said membrane being configured to be actuated by a force of one of: an electrostatic arrangement, a piezo-electric arrangement, and a bimorph membrane arrangement;

said method further comprising:

moving said membrane by one of: an electrostatic force, a piezo-electric force, and a bimorph membrane force.

37. (new) The method according to Claim 36, wherein said method further comprises:

determining aberrations of the eye of the patient with an aberrometer device configured to measure aberrations of the eye of the patient;

obtaining data indicative of the aberrations of the eye of the patient; and

correlating said data from said aberrometer indicative of the aberrations of the eye of the patient, with said vision correcting data computed from said optical system, as modified, resulting from said modified image having minimized distortions as perceived by the

patient.

38. (new) The method according to Claim 37, wherein said aberrometer device comprises a Shack-Hartmann sensor.

39. (new) The method according to Claim 38, wherein:

said electronic control system comprises a computer configured to compute vision correcting data using a Taylor polynomial and/or a Zernike polynomial;

said method further comprising:

computing vision correcting data, using a Taylor polynomial and/or a Zernike polynomial, on the basis of said data from said aberrometer indicative of the aberrations of the eye of the patient, and said vision correcting data computed from said optical system, as modified; and

applying corrective treatment to the eye being examined.

40. (new) The method according to Claim 35, comprising one of:

(a.) each micromirror is configured to be moved by a membrane; said membrane being configured to be actuated by a force of one of: an electrostatic arrangement, a piezo-electric arrangement, and a bimorph membrane arrangement;

Docket No.: NHL-ASC-01-C2  
Serial No.: 10/827,463  
Customer No.: 00432

said method further comprising:

moving said membrane by one of: an electrostatic force, a piezo-electric force, and a bimorph membrane force;

(b.) determining aberrations of the eye of the patient with an aberrometer device configured to measure aberrations of the eye of the patient;

obtaining data indicative of the aberrations of the eye of the patient; and

correlating said data from said aberrometer indicative of the aberrations of the eye of the patient, with said vision correcting data computed from said optical system, as modified, resulting from said modified image having minimized distortions as perceived by the patient;

(c.) said aberrometer device comprises a Shack-Hartmann sensor; and

(d.) said electronic control system comprises a computer configured to compute vision correcting data using a Taylor polynomial and/or a Zernike polynomial;

said method further comprising:

Docket No.: NHL-ASC-01-C2  
Serial No.: 10/827,463  
Customer No.: 00432

computing vision correcting data, using a Taylor polynomial and/or a Zernike polynomial, on the basis of said data from said aberrometer indicative of the aberrations of the eye of the patient, and said vision correcting data computed for the eye being examined from said optical system, as modified; and  
applying corrective treatment to the eye being examined.
